**Project description:**

The project will investigate chemical reactions yielding the nucleation and assembling of cell-instructing ceramic phases into 3-D porous bodies acting as scaffolds for regenerative medicine, particularly addressed to bone tissue. The new bioceramics will be obtained as micro-extrudable formulations with rheological properties thermally and chemically controlled to achieve consolidation into the final scaffolds at low temperature. This approach will uniquely permit to obtain 3D scaffolds capable of superior regenerative ability and mechanical performance. The Ph.D candidate will gain theoretical and practical skills in ceramic science and technology, particularly: - chemistry of calcium phosphates; -ceramic synthesis routes; -recrystallization phenomena; - powder processing; physicochemical, morphological mechanical and biological characterization methods. Non-conventional reactions in supercritical conditions and innovative heating technologies will be also investigated.
