

Mercoledì 27 settembre 2023 alle ore 15:00 presso l'aula G

il Dr. Alexander Pöthig

Department of Chemistry and Catalysis Research Center,
Technical University of Munich (TUM), Garching b. München,
Germany.

terrà il seminario dal titolo:

Supramolecular organometallic complexes and their host-guest and biomedical applications

M multinuclear NHC complexes of different metals form supramolecular organometallic complexes (SOC)¹ with very defined cavities and are able to selectively host guest ions or molecules. The dinuclear square-planarly coordinated complex (crisp) possesses the shape of a saddle, whose inner cavity can be used to encapsulate anions via formation of 2:1 tennis-ball like capsoplexes.^{2,3} The octanuclear silver(I) and gold(I) complex (pillarplex) have a tubular cavity which selectively incorporates linear molecules⁴ and can form (pseudo)rotaxanes.^{5,6} The structural features of the pillarplexes render these SOCs also ideal for interaction with negatively charged biomacromolecules. We have shown, that the pillarplex is able to interact with DNA, in particular so-called 4-way Holliday Junctions.⁷
